# PI-M Programmable Isolating Maths Function Transmitter. 

Programmable Isolating Maths Function Input to DC Current or DC Voltage Output Transmitter.

Features.

| ( Field Programmable Input and Output Ranges. |  |
| :--- | :--- |
| 0 | 29 Predefined Math Functions. |
| 12 Bit Resolution. (0.025\%) |  |
| 0 | Input to Output Isolation 1.6kV. |
| High Accuracy 0.1\%. |  |
| D | Universal AC/DC Power Supply. |
| Compact DIN Rail Mount Enclosure. |  |
| 120 Point User Definable Curve Fitting. |  |

## Ordering Information.

PI-M-X Standard Calibration:

C

Other Pl- models include: PI-B Bridge / Straingauge; PI-D DC; mA, mV, V. PI-F Frequency; PI-K Resistance; PI-M Maths Computing; PI-N RTD Differential Pt100 PI-P Potentiometer; PI-R RTD Pt100; PI-S Relay Dual Setpoint; PI-T Thermocouple.
PI-RAC RS-232 Hardware Interface for Programming the PI-M-T.

Note: Hi Select and Lo Select available from S/No. 9844000 onwards. POWER SUPPLY

| POWER SUPPLY | PS |
| :---: | :---: |
| High Voltage Power Supply: 85~264Vac/dc | H |
| Mid Voltage Power Supply: $22 \sim 85 \mathrm{Vac} / \mathrm{dc}$ | M |
| Low Voltage Power Supply: $10 \sim 28 \mathrm{Vac} / \mathrm{dc}$ | L |

Note: Power supply $H$ is field selectable for $M$, and $M$ for $H$. Power supply L must be ordered separately.
Ordering Examples.
1/ PI-M-A-3-9-L
0~5V Input; X-Y; 4~20mA Output; Low Voltage Power Supply.
2/ PI-M-Z-7-P-H-0/4V 0~4V Input; X/Y; -10~10V Output; High Voltage Power Supply.

## Quality Assurance Programme.

The modern technology and strict procedures of the ISO9001 Quality Assurance Programme applied during design, development, production and final inspection grant the long term reliability of the instrument.

PI-M Rev2 Specifications.

Product Liability. This information describes our products. It does not constitute guaranteed properties and is not intended to affirm the suitability of a product for a particular application. Due to ongoing research and development, designs, specifications, and documentation are subject to change without notification. Regrettably, omissions and exceptions cannot be completely ruled out. No liability will be accepted for errors, omissions or amendments to this specification. Technical data are always specified by their average values and are based on Standard Calibration Units at 25C, unless otherwise specified. Each product is subject to the 'Conditions of Sale'.
Warning: These products are not designed for use in, and should not be used for patient connected applications. In any critical installation an independant fail-safe back-up system must always be implemented.

PI-M Dimensions and Mounting.

## PI-M Input Range Programming Table.

Always set OUTPUT range first, then INPUT range.
DIP switches and Pots are accessed by removing the small rectangular lid on the top of the PI-M enclosure.
Notes: $\quad 1 /$ Switch status $1=O N, 0=O F F, X=$ DON'T CARE.
2/ All inputs must be of the same signal type.
3/ If using voltage inputs, short unused inputs to 'COM' (terminal 6).

|  | INPUT RANGE | S4-1 | S4-2 | S4-3 | S4-4 | S4-5 | S4-6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Vin | 0 | 0 | 0 | 0 | 1 | 1 |  |
|  | $0 \sim 5 \mathrm{~V}$ | $0 \sim 10 \mathrm{~V}$ |  |  |  |  |  |
|  | $1 \sim 5 \mathrm{~V}$ | 0 | 0 | 0 | 1 | 1 | 1 |
|  | $2 \sim 10 \mathrm{~V}$ | 0 | 0 | 0 | 0 | 0 |  |
| $\operatorname{lin}$ | $0 \sim 20 \mathrm{~mA}$ | 0 | 0 | 1 | 0 | 0 |  |
|  | 1 | 1 | 1 | 0 | 1 | 1 |  |
|  | 1 | 1 | 1 | 0 | 0 | 0 |  |

## How to Use the Maths Function Formulae.

$\mathrm{X}, \mathrm{Y}$, and Z are taken as 0 to 1.0000 , representing the full input range.
eg.

| 4.000 mA | $=$ | 0.0000 |
| :--- | :--- | :--- |
| 8.000 mA | $=$ | 0.2500 |
| 12.000 mA | $=$ | 0.5000 |
| 16.000 mA | $=0.7500$ |  |
| 20.000 mA | $=1.0000$ |  |

The selected calculation is then performed on the inputs. The output is then SCALED so the resultant range is between 0 and 1.000. (The scaling factor is the factor the largest output must be scaled by to get the result = 1 .) This 0 to 1.000 range represents the full output range, as set by the output DIP switches.

Examples of Using the Maths Function Formulae.
NOTE: For these examples inputs and outputs are configured as $4 \sim 20 \mathrm{~mA}$.

| Examples | Inputs (mA) |  |  | Converted Value |  |  | Resultant Value | Scaling Factor | Output Signal (mA) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

If $\mathrm{Y}<2.6 \mathrm{~V}$, Output $=\mathrm{X}$;
If $\mathrm{Y}>3.4 \mathrm{~V}$, Output $=$ Hold.

Set S4 Input Range Dip Switches as follows:

| S4-1 | S4-2 | S4-3 | S4-4 | S4-5 | S4-6 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 0 | 0 | 0 | 0 |

## PI-M Programming Instructions - User Defined Curve.

The PI-M allows a user to linearise specific curves, using the $x$ input. and by programming pairs of (x input,output). co-ordinates. The values are stored in a non-volatile EEPROM, and are entered using a computer terminal, with a basic text editor, and an RS-232 communications port. Up to 120 pairs of co-ordinates can be stored, and the PI-M uses linear interpolation to calculate intermediate values. The PI-M has 12-bit resolution on the input and output, uses 16 bits to store curve data, and uses floating point arithmetic for the interpolation.

## Requirements.

| PI-M | -Isolated transmitter with correct power supply. |
| :--- | :--- |
| PI-RAC | -PI-M to RS-232 interface. |
| PC Computer | -With spare RS-232 port. |
| Windows | -Installed on the PC. |

IMPORTANT: The RS-232 port is not isolated from the PI-M.

## Computer Setup.

Important: The power to the PI-M must be turned OFF before connecting the COMMS lead.
Connect the 10 pin (5 $\times 2$ ) header socket to the PI-RAC, with the RED stripe on the cable aligning with the large dot on the PI-M PCB. Connect the other end of the PI-RAC to an unused RS-232 COMMS port on the computer. (Usually COM2.)

## Entering User Defined Data.

1. Turn the PC on, and run WINDOWS.
2. Run NOTEPAD.
3. The format for the curve points is:

$$
\text { output = } f(x \text { input) ie. The 'x input' value is the input, and the output value is the corresponding output. }
$$

The curves must have a minimum of 2 points, and a maximum of 120 . The curve data is entered as:
$x$ input value <comma> output value <enter>

```
0,output<Enter>
input x2,output<Enter>
input x3,output<Enter>
input xn-1,output n-1<Enter>
100,output n<Enter>
```

Important: $\quad x$ input, and output values, are to be entered as percentages, between 0 and $100 \%$
The first $x$ input value must be $0 \%$ and the last must be $100 \%$.
The $x$ input values must increment from smallest to largest..
Once all the points have been entered, save the file as a .txt file.

## Examples of User Defined Data Files.

0,50
10,70
40,80
70,70
100,0

## Windows 95/98/2000/XP COMMS Port Configuration.

Before loading data into the PI-M the appropriate RS-232 COMMS port must be configured.
From WINDOWS click START, PROGRAMS, ACCESSORIES, HYPERTERMINAL.

If Hyperterminal is not visible on the Accessories menu, it will have to be added using Add/Remove Software in the Control Panel.

Double click on Hyperterminal. The new connection dialog box appears.
In 'Name:' enter: '"PIM on COMx" where 'x' is the ports the PI-M is connected to. Click 'OK'.
The Phone Number dialog box appears. In 'Connection Using:' select "Direct to Com x". Click 'OK'.
The COM x Properties dialog box appears.
Set the following parameters:
Bits per second 9600

Data Bits 8
Parity None

Stop Bits $\quad 1$ Flow Control Xon/Xoff
Click 'OK'.

Connect the PI-M to the selected port, apply the power, and the PI-M menu should appear in the Hyperterminalwindow.
When you close Hyperterminal, save the session when prompted. You can connect the PI-M again by double clicking "PIM on COMx" in the Hyperterminal folder.

## Downloading User Defined Data File to the PI-M.

Note: Downloading data to the PI-M will clear all previous user defined data from the PI-M EEPROM.
Select Maths Function 31 (Program User Curve) ie. Set the S3-MATHS dip switch on the PI-M to 111110 ( $0=0$ off, 1-on).
Power the PI-M. The following menu will appear in the TERMINAL window.
Select 1=Download User Table (Computer -> PI-M)
The TERMINAL window will display:
Initiating EEPROM. Please wait...
Wait for the LED to turn ON and the following menu to appear.
Download Table Now...
Press Escape When The PI-Ms LED Stops Flashing.
IMPORTANT: DO NOT press <Esc> until the following instructions have been completed.
From the TERMINAL Window Menu Bar:
Select Transfers
Select Send Text File...
Select the user defined data table as previously saved in NOTEPAD.
The LED in the PI-M will flash while data is being transferred. When it stops flashing press the <Esc> key. Press any key to return to the Configuration Menu.

To verify the table has been loaded correctly:
Select 2=Upload User Table (PI-M -> Computer)
The (x input,output) co-ordinates in the EEPROM will scroll in the TERMINAL window. (Note: Some of the values scrolled will have up to a $0.002 \%$ offset due to rounding.) The table will be followed by some extra pairs of 0,0 co-ordinates, signifying the end of the table.

If the co-ordinates differ more than a $0.002 \%$ from the .txt file downloaded, recheck the following, and download the .txt file again.

The COMMS port configuration.
The PI-RAC is connected to the PI-M correctly.
The PI-RAC is connected to the PC correctly.
The .txt file was selected correctly.

## Running the PI-M With the User Curve.

Select Maths Function 30 (User Defined Curve) ie Set S3-MATHS dip switch on the PI-M to 011110 ( $0=0$ off, $1=0$ ). Reset the PI-M by shorting the two header pins behind the S4-INPUT dip switch. The TERMINAL window will display:

## PI-M REV........

Mode 30 (User Function)
The LED will flash, signifying the PI-M is running. Turn the PI-M off, and disconnect the PI-RAC and the PC. Install the $\mathrm{PI}-\mathrm{M}$ as set out on the following page.

## PI-M Programming Instructions - Pressure Compensated Steam Flow.

The PI-M allows a user to linearise outputs for PCSFs, by being able to enter the following parameters:
The $100 \%$ input value,
The design pressure,
Linearisation.
Requirements.

| PI-M | Isolated transmitter with correct power supply. |
| :--- | :--- |
| PI-RAC | PI-M to RS-232 interface. |
| PC Computer | With spare RS-232 port. |
| Windows | Installed on the PC. |

IMPORTANT: The RS-232 port is NOT isolated from the PI-M.

## Computer Setup.

Important: The power to the PI-M must be turned OFF before connecting the COMMS lead.
Connect the 10 pin ( $5 \times 2$ ) header socket to the PI-RAC, with the RED stripe on the cable aligning with the large dot on the PI-M PCB. Connect the other end of the PI-RAC to an unused RS-232 communications port on the computer. (Usually COM2.)

## Programming PCSF Values.

Note: If the PI-M was previously set up with a User Defined Curve, the ( $\mathrm{X}, \mathrm{Y}$ ) values will be over written when PCSF values are entered.

$$
\begin{aligned}
& \text { X Input = Steam Flow. } \\
& \text { Y Input = Steam Pressure }
\end{aligned}
$$

Select Maths Function 33 ( $P C S F$ ) ie. Set the S3-MATHS dip switch on the PI-M to 100001 ( $0=0 \mathrm{ff}, 1$-on). Power the PI-M. The PCSF menu will appear in the TERMINAL window, with the current settings displayed.

To change the design pressure value Select '1', type in the new value, and press <Enter>.
To change the $100 \%$ input pressure value Select ' 2 ', type in the new $100 \%$ value, and press <Enter>.
To linearise Select '3', type in ' $\mathbf{Y}$ ' to select linearisation. (Linearisation = Square Root Extraction.)
Note: All pressure values are to be entered as kPa units.

## Running the PI-M With the PCSF Values.

Select Maths Function 32 ( $P C S F$ ) ie Set S3-MATHS dip switch on the PI-M to 000001 ( $0=0 \mathrm{ff}, 1=0 \mathrm{n}$ ). Reset the PI-M by shorting the two header pins behind the S4-INPUT dip switch. The PC will display the current settings.

## PI-M H1 Power Supply Jumper Settings.

WARNING: High Voltages Maybe Present.
Only adjust jumper with power disconnected.

| Power Supply Jumper Settings |  |
| :---: | :---: |
| H1 | Power Supply Voltage Range |
| H | Link for High: 85~264Vac/dc |
| M | Link for Mid: 22~85Vac/dc |

Notes:
1/ H1 is approx $4 \mathrm{~cm}\left(1 \frac{1}{2}\right.$ ") behind the ' S ' trimpot.
2/ Exceeding voltage ranges may damage the unit.
3/ Ensure the enclosure label is correctly labelled for the jumper position. 4/ Adjust H1 jumper with a pair of needle nose pliers.
5/ Low Voltage Power Supply version is fixed, and has no jumper. This must be ordered separately.

Output Range Programming Table.
Notes: $1 / \quad$ Switch status $1=O N \quad 0=O F F$
2/
Output ranges with ' $*$ ' beside them reverse the polarity of the output connections.

| Output Range (V) | S1-SPAN |  |  |  |  |  | S2-Function |  |  |  | Output Range (I) | S1-SPAN |  |  |  |  |  | S2-Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 1 | 2 | 3 | 4 |  | 1 | 2 | 3 | 4 | 5 | 6 | 1 | 2 | 3 | 4 |
| 0~500mV | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 0~1mA | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| 0~1V | 1 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 0~2mA | 1 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

## The Proper Installation \& Maintenance of PI-M.

Note. All power and signals must be de-energised before connecting any wiring, altering any jumpers or DIP switches, or inserting or removing the PI unit from it's base.

## MOUNTING.

(1) Mount in a clean environment in an electrical cabinet on 35 mm Symmetrical mounting rail.
(2) Draft holes must have minimum free air space of 20 mm . Foreign matter must not enter or block draft holes.
(3) Do not subject to vibration or excess temperature or humidity variations.
(4) Avoid mounting in cabinets with power control equipment.
(5) To maintain compliance with the EMC Directives the PI-M is to be mounted in a fully enclosed steel cabinet. The cabinet must be properly earthed, with appropriate input / output entry points and cabling.

## WIRING

(1) A readily accessible disconnect device and a $1 \mathrm{~A}, 250 \mathrm{Vac}$ overcurrent device, must be in the power supply wiring.
(2) All cables should be good quality overall screened INSTRUMENTATION CABLE with the screen earthed at one end only.
(3) Signal Cables should be laid a minimum distance of 300 mm from any power cables.
(4) For 2 wire current loops and 2 wire voltage signals or 2 wire current signals, Austral Standard Cables B5102ES is recommended. For 3 wire transmitters Austral Standard Cables B5103ES is recommended.
(5) It is recommended that you do not ground current loops and use power supplies with ungrounded outputs.
(6) Lightning arrestors should be used when there is a danger from this source.
(7) Refer to diagrams for connection information.

## COMMISSIONING.

(1) Once all the above conditions have been carried out and the wiring checked apply power to the $\mathrm{PI}-\mathrm{M}$ and allow five minutes for it to stabilize.
(2) Take a low (approx 10\%) and high (approx 90\%) reading of the variable being measured by the transducer supplying the signal to the PI-M, and ensure that this agrees with the level being indicated by the PLC or indicator, etc, that the PI-M is connected into. Adjust for any difference using the Zero and Span Pots in the top of the PI-M enclosure with a small screwdriver until the two levels agree. (Clockwise to increase the output reading and anti-clockwise to decrease the output reading.)

## MAINTENANCE.

(1) Repeat (2) of Commissioning.
(2) Do it regularly - at least once every 12 months.
